(54) THIS: WEAR RESISTANT COSMETICS

(57) Abstract

A wear-resistant cosmetic composition including a styreno-ethylene/propylene mixed block copolymer, preferably from about 0.1 weight percent to about 15 weight percent, in a cosmetically acceptable currier. The cosmetic composition may also include an alkyl cycloalkylacrylate copolymer, preferably from about 0.1 weight percent to about 15 weight percent.

WEAR RESISTANT COSMETICS

The present invention relates generally to wear resistant cosmetic compositions. More particularly, this invention relates to a cosmetic composition containing a styrene-ethylene/propylene mixed block copolymer that demonstrates enhanced wear in combination with a smooth, non-tacky feel.

BACKGROUND OF THE INVENTION

10

20

30

Various organic waxes and film formers are known in the art for their ability to impart uniform films and protective barriers to the skin and lips. Most of these films are slow to dry on application. Because these films remain wet for extended periods of time, they adhere poorly and tend to transfer off the surface to which they are applied. This results in poor overall cosmetic wear, and requires that the user reapply the cosmetic frequently.

Those film formers that provide somewhat more rapid drying times have additional limitations. The primary limitation of these film formers is an unpleasant tacky feel on application to the skin, lips or lashes that is disliked by consumers. Also, these products tend to drag against the skin when applied, and leave the skin feeling dry and sticky.

Accordingly, there is a need for a wear-resistant cosmetic that forms a protective film on the skin that is also quick to dry and easy to apply, but does not have an unpleasant, undesirable tacky feel on the skin.

SUMMARY OF THE INVENTION

Against the foregoing background, it is a primary object of the present invention to provide a cosmetic composition having enhanced wear resistance.

It is another object of the present invention to provide a cosmetic composition that produces a quick drying protective film on the skin.

It is yet another object of the present invention to provide a wear resistant cosmetic composition that is not tacky and neither drags against the skin upon application nor dries the skin.

To the accomplishment of the foregoing objects and advantages, the present invention, in brief summary, comprises a wear-resistant cosmetic composition including a styrene-ethylene/propylene mixed block copolymer, preferably at from about 0.01 weight percent to about 85 weight percent, in a cosmetically acceptable carrier. The cosmetic composition may also include an alkyl cycloalkylacrylate copolymer, preferably at from about 0.01 weight percent to about 85 weight percent.

10

DESCRIPTION OF THE PREFERRED EMBODIMENTS

The present invention provides a wear-resistant 20 cosmetic such as, for example, a lipstick, foundation, eye shadow, blush or mascara. It has surprisingly been found that a styreneethylene/propylene mixed block copolymer provides superior wear resistance to such cosmetic 25 compositions or formulas, both alone and preferably in combination with an alkyl cyclcalkylacrylate copolymer. Moreover, it has surprisingly been found that cosmetic formulas containing the styreneethylene/propylene mixed block copolymer are non-30 tacky and have a pleasant feel when applied to the skin. These compositions are masy to apply, have improved skin and lip adherence (transfer resistance), and provide enhanced wear and longevity.

Most preferably, the wear-resistant cosmetic composition according to the present invention includes a styrene-ethylene/propylene mixed block copolymer in a cosmetically acceptable carrier. This cosmetic composition may also include an alkyl cycloalkylacrylate copolymer as a primary ingredient or in combination with the mixed-block copolymer.

The preferred styrene-ethylene/propylene mixed block copolymer of the present invention is a block copolymer made up of styrene, ethylene and propylene type monomers having the following general structure:

Styrene

$$R_1 - C = C \left(\begin{array}{c} R_2 \\ R_3 \end{array} \right)$$

15

$$R_{1}$$
 $C = C \setminus R_{3}$

Propylene

where R₁ to R₆ are independently hydrophobic alkyl chains. One possible structure of the copolymer, with the repeating monomer subset shown in brackets, is:

wherein $n \ge 1$ and the R groups may be the same or different, and are independently hydrophobic alkyl chains.

The most preferred styrene-ethylene/propylene mixed block copolymer for use in the present invention is available from Brooks Industries as Gel Base (Code 05895). Gel Base (Code 05895) is a styrene-ethylene/propylene mixed block copolymer in combination with isododecane, that is provided as a cloudy white gel. The specific structure of the Gel Base (Code 05895) styrene-ethylene/propylene mixed block copolymer is proprietary to Brooks Industries.

This mixed block copolymer is not water soluble, but is soluble in certain oils and hydrocarbon solvents such as isoparaffin and isododecane. This allows the mixed block copolymer to be delivered in a volatile solvent base to the skin. Once delivered, the volatile solvent evaporates, at least partially, leaving the water insoluble mixed block copolymer film on the skin. This film resists transfer and wear. The mixed block copolymer is most preferably used in combination with a silicone-containing base (containing, for example, dimethicone/cyclomethicone) or an organic volatile in an aqueous base, for suporiox feel and weer.

20

PCT/US98/04104 WO 98/42298

In a preferred embodiment, the styreneethylene/propylene mixed block copolymer is from about 0.01 percent by weight to about 85 percent by weight (weight percent) of the total weight of the In the most preferred embodiment, the 5 composition. styrene-ethylene/propylene mixed block copolymer is from about 0.1 to about 15 percent by weight of the composition. It should be understood that one or more styrene-ethylene/propylene mixed block copolymers may be used in the present compositions.

When the composition includes the alkylcycloalkylacrylate copolymer, the preferred alkyl cycloalkylacrylate copolymer is a copolymer or copolymers having the following formulas and the isomers thereof:

20

where R_i to R₄ are independently hydrophobic alkyl chains. The alkyl cycloalkylacrylate copolymers are soluble in hydrocarbons, such as isododecane, but not in water, thus enhancing the film-forming effect of the copolymer in a volatile solvent base.

When included, the alkyl cycloalkylacrylate 10 copolymer or copolymers can be from about 0.01 percent by weight to about 85 percent by weight.

Preferably, this copolymer is about 0.1 percent by weight to about 15 percent by weight of the composition.

15

25

The composition may also include other ingredients, such as a volatile solvent, wax, powder, non-volatile oil, and emulsifier.

The volatile solvent of the present invention acts as a carrier for the other components of the cosmetic, rapidly and evenly dispersing them on the skin, and then evaporating. The preferred volatile solvent includes C₆ to C₂₀ hydrocarbon fractions, more preferably an isoparaffin and most preferably the specific C₁₂ fraction isododecame. Alternatively, cyclomethicone, up to a preferred limit of about 30 weight percent, is also favored.

The volatile solvent may be present in an amount from about 0.01 percent by weight to about 85 percent by weight. However, in certain compositions, less volatile solvent than the maximum 85 percent by weight is desired. For example, a foundation preferably contains no more than about 50 percent by weight of volatile solvent. One or more volatile solvents may be present in the above total amount.

10

15

20

The preferred wax or waxes can be of vegetable, synthetic or hydrocarbon origin. The wax preferably should have a melting point in the range between about 35°C to 120°C. The wax is present in an amount from about 0.01 percent by weight to about 50 percent by weight of the composition. A greater amount of wax is preferred in an anhydrous blush or lipstick than in a mascara. Therefore, the amount of wax in an anhydrous blush or lipstick is preferably about 0.01 percent by weight to about 50 percent by weight, whereas in a mascara, the amount of wax is preferably about 0.01 to about 25 percent by weight of the composition.

The dry powder, as discussed above, gives color and sheen to the cosmetics of the present composition. The preferred dry powder includes an organic or an inorganic powder or a combination thereof. The dry powder preferably is a certified organic lake, a stain or an inorganic pigment having a particle size between about 0.02 and about 85 microns in diameter. The dry powder or powders component is preferably present in an amount from about 0.1 percent by weight to about 65 percent by weight of the composition, with the higher figure most suitable for such products as lipsticks or foundations. A blush or mase ra preferably contains no more than about 20 to 25 weight percent of powder.

It is also preferred, depending on the final product being formulated, to include a nonvolatile oil, emulsifier, water or a combination thereof to the finished cosmetic composition. The copolymers of the present invention are suitable for use in both water-based and anhydrous systems.

A preferred cosmetic composition according to the present invention comprises from about 0.01 weight percent to about 85 weight percent of a block copolymer of styrene, ethylene and propylene type monomers. In a more preferred embodiment, the composition also includes from about 0.01 weight percent to about 85 weight percent of alkyl cycloalkylacrylate copolymer. Another preferred cosmetic composition according to the present invention comprises:

10

20

- from about 0.01 weight percent to about 85 weight percent of a block copolymer of styrene,
 ethylene and propylene type monomers;
- 2) from about 0.01 weight percent to about 85 weight percent of alkyl cycloalkylacrylate copolymer:
- 3) from about 0.01 weight percent to about 85 weight percent volatile solvent;
- from about 0.01 weight percent to about 50
 weight percent wax;
 - 5) from about 0.1 weight percent to about 65 weight percent dry powder; and
- 6) from about 0.01 weight percent to about 80 weight percent non-volatile oil, emulsifier and/or 30 water.

As discussed above, one or more of each ingredient may be used, but with the total amount of that ingredient set forth above.

Within the preferred ranges set forth above, the sollowing Examples 1 through 3 set forth presented

subset compositions for foundations, blushes or lipsticks, and mascaras, respectively.

The invention having been thus described with particular reference to the preferred forms thereof,

it will be obvious that various changes and modifications may be made therein without departing from the spirit and scope of the invention as defined in the appended claims

....

What we claim is:

- A wear-resistant cosmetic composition comprising a styrene-ethylene/propylene mixed block sopolymer in a cosmetically acceptable carrier.
 - 2. The cosmetic composition of claim 1, wherein said styrene-ethylene/propylene mixed block copolymer is of a structure as follows:

10

wherein $n \ge 1$ and R represents independently hydrophobic alkyl groups of identical or different types.

15

20

- 3. The cosmetic composition of claim 1, wherein said styrene-ethylene/propylene mixed block copolymer is present from about 0.01 percent by weight to about 85 percent by weight of a total composition weight.
- 4. The cosmetic composition of claim 1, wherein said styrene-ethylene/propylene mixed block copolymer is present from about 0.1 weight percent to about 15 percent by weight of a total composition weight.

- 5. The cosmetic composition of claim 1, further comprising an alkyl cycloalkylacrylate copolymer.
- 6. The cosmetic composition of claim 5, wherein said alkyl cycloalkylacrylate copolymer is of a structure selected from the group consisting of Structure A, Structure B, an isomer of Structure A, an isomer of Structure B, and a combination thereof:

10

R₂ C = 0 R₁

R4

Structure A

where R1 to R4 are independently hydrophobic alkyl chains.

- 7. The cosmetic composition of claim 5, wherein said alkyl cycloalkylacrylate copolymer is present at from about 0.01 weight percent to about 85 weight percent.
- 6. The cosmetic composition of claim 5, wherein said alkyl cycloalkylacrylate copolymer is present at from about 0.1 weight percent to about 15 weight percent.
- 9. The cosmetic composition of claim 1, wherein said carrier comprises a volatile solvent.
 - 10. The cosmetic composition of claim 9, wherein said volatile solvent is present at from about 0.01 weight percent to about 85 weight percent.
 - 11. The cosmetic composition of claim 10, wherein said volatile solvent includes a volatile hydrocarbon.
- 25 12. The cosmetic composition of claim 10, wherein said volatile solvent is silicon-based.

20

- 13. The cosmetic composition of claim 1, wherein said carrier includes a volatile hydrocarbon.
- 14. The cosmetic composition of claim 1, wherein said carrier includes silicone.

15. The cosmetic composition of claim 1, further comprising from about 0.01 weight percent to about 50 weight percent wax.

- 16. The cosmetic composition of claim 1, further comprising from about 0.1 weight percent to about 65 weight percent dry powder.
- 17. The cosmetic composition of claim 1, wherein said carrier comprises water.
 - 18. The cosmetic composition of claim 1, further comprising a non-volatile oil.
- 15 19. The cosmetic composition of claim 1, further comprising an emulsifier.

20

25

- 20. A wear-resistant cosmetic composition comprising an alkyl cycloalkylacrylate copolymer.
- 21. A wear-resistant cosmetic composition comprising:

from about 0.01 to about 30 percent by weight styrene-ethylene/propylene mixed block copolymer;

from about 0.01 to about 50 percent by weight alkyl cyclomethacrylate copolymer;

from about 0.01 to about 70 percent by weight volatile solvent;

from about 0.01 to 50 percent by weight wax; and from about 0.1 to 65 percent powders.
